📓 Release Notes: DB Explorer v3.0.1 - The "AI Power" Update

Release Date: April 10, 2026
Publisher: Astro Adept AI Labs
Version: 3.0.1

🚀 Overview

This major update transforms DB Explorer from a database management tool with AI features into a truly **AI-First Database Development Environment**. We have completely overhauled our AI integration to support multiple providers, flexible model configurations, and a more responsive, context-aware user experience.

⭐ New Features

1. Multi-Provider AI Support

Connect to your preferred Large Language Model (LLM) with native support for:

- **OpenAI:** Support for the latest models including `gpt-5-nano` and the `o1` reasoning series.
- **Anthropic (Claude):** Native integration with Claude 3.5 Sonnet and the upcoming models.
- **Google Gemini:** High-performance integration with Gemini 1.5 Pro and Flash.
- **DeepSeek:** Optimized support for DeepSeek's chat and coder models.

2. Unlimited AI Profiles & Persistence

You are no longer limited to a single AI configuration.

- **Multiple Profiles:** Create and save multiple configurations (e.g., "Work OpenAI", "Research Gemini", "Private Claude").
- **Profile Management:** Easily add, edit, or delete profiles in the new sidebar-driven configuration window.
- **Session Persistence:** DB Explorer now remembers your last-used AI profile across sessions, so you can pick up exactly where you left off.

3. Strictly Context-Aware Assistant

The AI Assistant is now smarter about your environment:

- **Database Context Enforced:** The Assistant now requires an active, connected database to function, ensuring suggestions are always grounded in your actual schema.
- **Visual Context Bar:** A new header in the AI window displays your current database context (e.g., `Database Context: PROD_DB (POSTGRESQL)`).
- **Smart Prompting:** Automatic schema extraction is now strictly bound to the selected connection to prevent cross-database hallucinations.

🔧 Enhancements & UI Improvements

- **Flexible Model Configuration:** The Model Name field is now free-text, allowing you to use newly released models immediately without waiting for a software update.
- **Smart URL Mapping:** Base URLs now auto-populate based on the selected provider while remaining fully overridable for enterprise proxies.
- **Visual Feedback:** Added a high-fidelity indeterminate progress bar with the message *"AI is thinking..."* to provide real-time feedback during API calls.
- **Automatic Naming:** New AI configurations are automatically named using the `<provider>-<model>` format for faster setup.
- **Dynamic Parameter Handling:**
  - Automatic switching between `max_tokens` and `max_completion_tokens` for reasoning models.
  - Conditional `temperature` handling to satisfy stricter API requirements of newer models.

🛠 Technical Fixes

- Fixed a 404 error occurring during Claude API test connections.
- Resolved a bug where the Base URL was not properly clearing when switching between Custom and Native providers.
- Fixed a UI glitch where the progress bar would occasionally remain hidden after a failed API call.
- Improved API error reporting to show specific status codes and messages from providers.
